

## **Aerosol Production and Exposure Control**

## **Examples of Aerosol-Producing Activities in the Lab:**

- blowing out pipettes
- · cell sorters
- · shaking or vortexing tubes, stirring
- opening lyophilized cultures, opening snap top tubes, breakage of culture containers
- flaming loops or slides
- pulling needles out of septums, filling a syringe
- pouring liquids
- centrifugation steps such as filling centrifuge tubes, removing plugs or caps from tubes after centrifugation, removing supernatant, resuspending sedimented pellets, breakage of tubes during centrifugation, and centrifugation itself
- sonicating, homogenizing, blending, grinding, cell disruption with French press
- · intranasal inoculation of animals
- · cage cleaning, changing animal bedding
- harvesting infected material from animals, eggs, and other virology procedures
- · necropsies of infected animals

## Safe Work Practices to Minimize the Creation of and Exposure to Aerosols:

Using a combination of the appropriate safety equipment and safe procedures is the primary method to minimize the creation of and exposure to aerosols.

Lab safety equipment to protect personnel from aerosols

- The certified <u>biological safety cabinet (class I or II)</u> is the primary barrier to protect worker from aerosols. Other safety devices include safety centrifuges with automatic locking mechanisms or solid lids, safety centrifuge cups, safety blenders, safety sonicators.
  - If aerosol production cannot be prevented or contained, see the <u>USA Safety and Environmental</u> <u>Compliance to</u> determine if use of a respirator is appropriate.
  - For animal work follow CDC *Biosafety in Microbiological and Biomedical Laboratories animal biosafety guideline.*
